

Abstract of the Disclosure

The invention concerns a syringe for parenteral injection of a semi-solid formulation, comprising a hollow element (1) forming a reservoir for the semi-solid product to be injected between a plunger and a needle (3) hub (4) urged in contact with the said reservoir (1) end, such that the plunger (2) comes into direct contact with said hub (4) when the dose contained in said reservoir-forming element has been injected, said element forming a reservoir (1) and said needle (3) are maintained mutually interlocked at said hub through a mount or case (5,7) receiving said element forming a reservoir (1).
